Given a set U , the set of binary relations over U is a semiring with addition the union (of relations as sets) and multiplication the composition of relations. The semiring's zero is the empty relation and its unit is the identity relation. ... Semirings and Affine Equations over Them. Springer Science & Business Media.

In many common semirings there is a possibility of infinite summation, and so we need to consider that possibility too. In particular, a semiring R is complete if and only if to each function $f : \Omega \rightarrow R$, where Ω is a nonempty set, we can assign a value $\sum f$ in R such that the following conditions are satisfied:

Abstract. If n is a positive integer and R is a semiring then the collection $M_n(R)$ of all $n \times n$ matrices over R is again a semiring, the addition in which is componentwise and multiplication in which is given by the usual rule of matrix multiplication: if $A = [a_{ij}]$ and $B = [b_{ij}]$ are such matrices then $AB = [c_{ij}]$...

In this paper, we investigate 2-absorbing ideals of commutative semirings and prove that if \mathfrak{a} is a nonzero proper ideal of a subtractive valuation semiring S then \mathfrak{a} is a 2-absorbing ideal of S if and only if $\mathfrak{a} = \mathfrak{p}$ or $\mathfrak{a} = \mathfrak{p}^2$ where $\mathfrak{p} = \mathfrak{p}$ is a prime ideal of S .

The linear subspaces of a unital algebra over a field form a Kleene algebra. Given linear subspaces V and W , define $V + W$ to be the sum of the two subspaces, and 0 to be the trivial subspace $\{0\}$. Define $V \cdot W = \text{span} \{v \cdot w \mid v \in V, w \in W\}$, the linear span of the product of vectors from V and W respectively.

If A is another affine space over the same vector space (that is) the choice of any point a in A defines a unique affine isomorphism, which is the identity of V and maps a to o . In other words, the choice of an origin a in A allows us to identify A and (V, V) up to a canonical isomorphism.
